

ULTIMATE BED CARRIER

ABSTRACT OF THE DISCLOSURE

A cart for transporting a hospital bed is described. The cart includes an approximately rectangular bottom panel, between two and eight wheels physically attached to the bottom panel, and at least one approximately rectangular side panel that can be attached to one edge of the bottom panel in an approximately perpendicular arrangement. At least one panel has a notch along its upper edge. The notch is adapted for immobilizing a component of a hospital bed frame when the frame is loaded on the cart. In some arrangements, a second side panel approximately parallel to the first side panel can be attached to another edge of the bottom panel. The panels can include lining layers.
